

CodingSystem

Accelerated code search and assignment for precise productivity

Alpha II CodingSystem's comprehensive front-end code search and coding edit capabilities power essential revenue improvement efforts.

An interactive software tool, Alpha II helps medical coders work many times faster than possible with manual reference books. But perhaps more important than this efficiency, the Alpha II content database practically guarantees that the resulting work will be both accurate and complete.

Precise coding can minimize denials, demonstrate medical necessity, ensure compliance, and help organizations capture more legitimate reimbursement.

The original coding software for outpatient healthcare, conceptualized in the early 1980s by a physician, CodingSystem serves thousands of professional coders, nurses, charge entry personnel, schedulers and consultants. Today, due to its clinically-oriented design, it's also used by doctors. Even a state Medicaid agency puts CodingSystem's support for advanced medical decision-making to work as an auditing tool.

**CodingSystem accelerates
precise coding—
minimizing denials,
improving productivity
and ensuring compliance.**

CodingSystem functions

CodingSystem accelerates and enhances front-end code search and assignment on the strength of the industry's most comprehensive medical coding content database:

- ICD-9, CPT® and HCPCS codes
 - ◆ ICD-9 ultimate specificity
- Comprehensive, proprietary medical necessity edits
- CCI bundling/unbundling edits
- Modifier usage correction and recommendations
- E&M code generator
- RVU sequencing
- CPT notes in support of coding or billing decisions
- Global fee period calculation

CodingSystem features

Though CodingSystem is an intuitive, stand-alone application that installs quickly, it's also a complete desktop solution that allows users to look up codes and perform edits all in one program.

Sophisticated E&M generation

Alpha II's proprietary tools for E&M generation help healthcare providers strengthen reimbursement by avoiding under-coding and maintain compliance by preventing over-coding. Given the risks of over-coding, many organizations tend to under-code as a precaution. But because CodingSystem has the intelligence to calculate medical complexity, the application can provide an accurate basis for the often subjective medical decision-making component of E&M billing. Based on documentation, number of diagnoses, amount of data, and mortality and morbidity risk, CodingSystem can generate compliant, objective E&M coding.

Clinically-oriented search methodology

Alpha II's database design enables clinically-oriented code searches. Users can look up codes based on official condition name, common name, acronym or site. With CodingSystem, code search more closely resembles the way patients are actually diagnosed.
